SOLUTION HIGHLIGHTS

Increase your business performances

Combining advanced IT technologies and organizational methodologies, RHD increases business performances

Integrate with your organization

The possibility of building custom workflows and choosing modules (or create new) according to the business needs, along with the ability to communicate with the technologies already in use within the organization, make RHD an extremely scalable and flexible tool, fully adaptable to almost every business's architecture and scenario.

Share relevant information in real time

Through the RHD portal, every actor of the process has easy and real time access to all the information he needs, with the possibility to choose the best level of detail depending on the task he needs to perform.

Get a complete, clear view of all your information

Fully customizable dashboards, including various types of charts and graphs for data visualization, allow a complete, clear and simple presentation and availability of all the information

Make faster decisions

Providing real time availability of information from different sources, already made consistent with each other and grouped in modules, RHD significantly reduces the time required for information processing, allowing faster and better decision making.

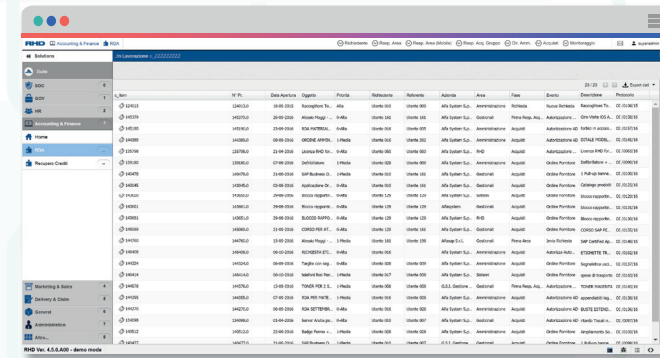

Keep track of everything

All the information is collected and stored in a single repository, and the history of every single document or process is fully tracked, making data and information retrieval much faster and easier.

Integration with:

GATHER, ORCHESTRATE & MANAGE ALL FROM A SINGLE PLATFORM

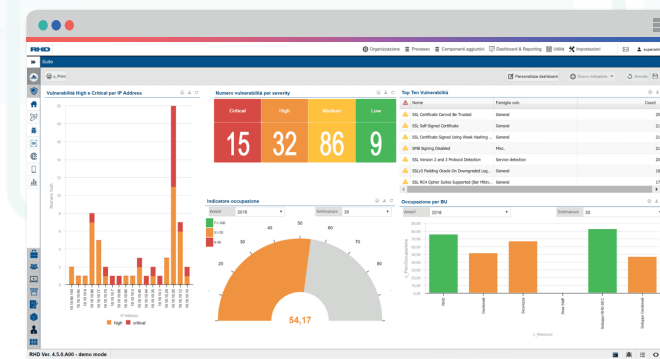

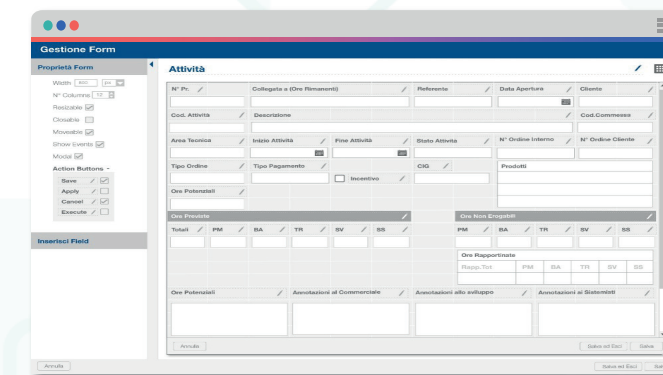

Collect

Through the use of connectors, RHD is able to "communicate" with external sources (such as Vulnerability management technologies, Anti Fraud engines, Intelligence feeds, Endpoint Security softwares) automatically collecting information and connecting them with each other.

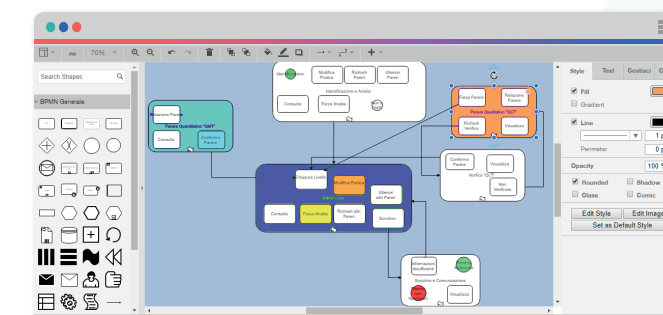

Input

Along with automatic gathering from technological sources, RHD also allows manual input: through custom forms, file attachments and communication with external systems, the actors of the process can enter information which will be included in the workflow and made available for other users.

Orchestrate

Data and information coming from automated or human sources are gathered together and made consistent with each other, and presented in a single pane of glass. This provides a full picture of the current state, a complete overview on the current status of monitored practices and processes

Manage

RHD provides custom workflow building, which allows to define the steps and actors of the process according to the company roles and organization. The result is a series of tailored workflows for the management of every business process based on the acquired or entered in the platform.

ALL THE INFORMATION YOU NEED, THE WAY YOU NEED IT

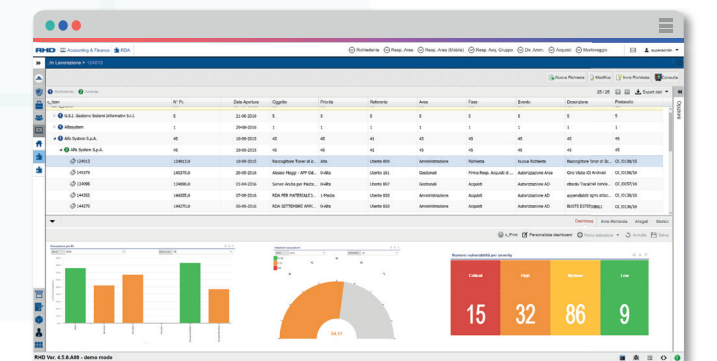

Extensive overview through dashboards

In RHD's customizable dashboard pane, data and information are presented through charts and graphs completely defined by the user, providing an extensive overview and easy orchestration of all of the managed processes. From the main dashboard, it is possible to switch to the detailed display of individual information in a single click.

Drill-down on information details

In the detail view, data and information can be navigated through different levels of details and sub-sets, whose characteristics are fully customizable and defined by the user. New dashboards and charts can be generated based on the data aggregation level.

Cross browser, cross device

RHD's interface is responsive and supported from most desktop and mobile browsers and devices
